Data Description

Variables were evaluated for normality using Shapiro-Wilk tests. Skewness and kurtosis were determined in the summary statistics section in JMP distribution analysis.

Observations for average GDP between 2020 and 2024 appear to be somewhat normally distributed (Shapiro-Wilk $W=0.91$) and the most bell-shaped of all variables (Kurtosis=2.15). It demonstrates a right skew (1.22) and three outliers in the high portion of the range.

Hofstede's Cultural Dimension for Power Distance observations are generally normally distributed (Shapiro-Wilk $W=0.99$). They appear to be nearly symmetrical (0.01) and platykurtic (Kurtosis=-0.3) with no heavy tails or outliers.

Hofstede's Cultural Dimension for Individualism observations, despite its symmetry (0.22), appear to be multi-modal as opposed to normally distributed and much flatter than normal (Kurtosis=-1.26).

Hofstede's Cultural Dimension for Masculinity observations are normally distributed (Shapiro-Wilk $W=0.98$) and symmetrical (Skewness=0.2). It is platykurtic (Kurtosis=0.86), possesses heavier tails than normal and is the only dimension to have outliers present.

Hofstede's Cultural Dimension for Uncertainty Avoidance observations are mostly normal with a slight left skew (-0.35). Observations for this dimension appear to be flatter than normal (Kurtosis=-0.65) with no outliers.

Hofstede's Cultural Dimension for Long-Term Orientation observation distribution appear to be mostly normal (Shapiro-Wilk $W=0.97$), symmetrical (Skewness=0.17) and considerably more flat (Kurtosis=-0.82) compared to the other dimensions.

Hofstede's Cultural Dimension for Indulgence observations appear mostly normal (Shapiro-Wilk $W=0.98$), flat (Kurtosis=-0.68) and a slight right (Skewness=0.13) distribution.
